How SYZYGY works today

syzygybot.com, as it runs on 26 October 2026. Everything here was checked against the code and the live database that day.

SYZYGY finds brand deals with Qloo's taste data, then does the legwork around each one. It works out who to approach, finds the person who decides, writes the message and checks it against the rules. Nothing goes out until a person says yes. Think of it as a booking agent's back office that never sleeps but never hits send on its own.

The pages you'll use

The front page (the live floor)

A feed of what the agents are doing right now inside the desks: runs starting, cards moving, decisions. Below it are 14 counters. The first three are the live ones: desk runs, brands measured both ways, and cards filed by runs.

/desk, where you pick a desk

Four ways in:

- The seven built-in desks. Six were written with a hackathon judge in mind (TWiST, Qloo enterprise sales, studio clearance, Golden Globes, Cedric the Entertainer, Live Nation), plus the Bad Bunny touring demo.
- "Desks people set up". Five so far: Liquid Death, two for Becky G, WWE, and Onenept Studios.
- Search. Type a name and Qloo looks it up. A clear, exact match ("Nike", "Drake", "Hot Ones") opens its desk straight away, setting one up if it's new. A vague one ("becky") shows a list with photos so you can pick.
- A website. Type "onenept.com" in the search, or use the "Not in Qloo?" form under it, and SYZYGY sets up a desk for a business Qloo has never heard of. More on that below.

A desk

Opening a desk gives your browser its own private workspace, held in a cookie. What you approve or reject is yours alone. Another visitor sees the same cards undecided. There's a cap of 400 new workspaces a day.

What happens when you open a desk

A live run starts. If one is already going, you join it. If one finished in the last three minutes, you see that one instead. "Run it again" forces a fresh one. Runs are capped at 120 a day across every desk, and each costs roughly $0.30 in model calls (an estimate in the code, not a billed figure).

Each desk works from a few lanes, like "brands Bad Bunny's fans lean toward" or "acts the crowd at this room likes". Every candidate a lane picks becomes a card, and the card walks across the board:

Scout spots 12 candidates per lane in Qloo	**Numbers** Qloo's score both ways, the weaker one counts	**Deal check** drops brands the talent already works with	**Rival check** drops competitors of those partners	**Contact finder** the person who decides, plus the published inbox or postal address
Verifier keeps a contact only if it read it on a page itself	**Writer** drafts an email, or a letter if there's no inbox	**Clearance** seven rules, then filed for you	**Sequencer** after you approve, sends in the recipient's window	**Inbox** sorts the replies

That's the ten. The first eight run before you see a card. The last two only work after a person approves one.

A run takes a few minutes, with two cards in flight at a time. The Writer is Gemini 4 Argon, which won a blind test against 3.1 Pro and three Flash models. If Argon is slow or busy, 3.1 Pro takes the call.

Rival check, the newest agent

Added 24 October. Before a desk pitches a brand, Rival check looks up who the desk's subject already works with: a talent's brand deals, or a venue's or show's sponsors. Then it searches the web for each partner's direct competitors and keeps those lists for a month. A brand on that list never becomes a card. So Bad Bunny's desk won't pitch Nike, because Bad Bunny has an Adidas deal.

The web's rival lists are narrow, though. "Fashion rivals of Calvin Klein" doesn't include Zara. So before anything is drafted, Rival check also asks Clearance's exclusivity judge, which reads categories more widely, and drops the card if it would be held. In the test run on Bad Bunny it skipped 14 brands up front and dropped 3 more at that second check. Only clean cards were filed.

Qloo's own data-sales desk is left out on purpose, since a competitor of a Qloo client is still a fine prospect. Venue sponsor lists are only as good as what the web search finds.

Businesses Qloo doesn't know

Added 26 October. Most businesses will never be in Qloo. Onenept isn't. Qloo can't score a name it has never seen, so a search for one used to dead-end.

Now you give the website instead. SYZYGY reads the home page and the about page, and the model picks ten well-known podcasts, brands, shows or people whose audience is that business's audience. Each pick only counts if Qloo has that exact name. It keeps up to five, at most three of a kind, and needs at least two or it gives up and says so. Those are the anchors.

Think of anchors as borrowed ears. Qloo doesn't know who follows Onenept, but it knows who follows GitHub, Y Combinator, the Lex Fridman Podcast and Silicon Valley, and that crowd is close enough. So the desk reads their audience together.

A website desk gets three lanes: people to pitch as ambassadors, podcasts to pitch, and brands for co-marketing. Both numbers on every card are still Qloo's. "Toward" is how the anchors' audience leans toward the candidate. "Back" is how the candidate's audience leans toward the anchors, measured kind by kind, since Qloo filters one type per call. The card says "Measured against 4 anchors", and the draft is honest that the numbers came from the anchors and not from the business itself.

The anchors are the whole read, so they sit in a panel at the top of the desk. Anyone can see them. Only the desk's verified owner can change them: remove one (two is the floor), add one by name (six is the ceiling), then press "Run it again with these anchors". The change counts from the next run.

The Onenept desk. syzygybot.com/desk/my-onenept-studios-nys, set up from onenept.com. Anchors: GitHub, Y Combinator, Lex Fridman Podcast, Silicon Valley. It verifies at onenept.com. The cards so far include Paul Graham, Making Sense with Sam Harris, Philosophize This!, Acquired, Webflow and DigitalOcean. The ambassador lane goes for very famous people, so a podcast or brand card is the believable one to send.

Up to 60 website desks can be set up a day. Opening any desk starts a live run if the last one finished more than three minutes ago, so every visit adds cards.

A card, and your buttons

Each card shows Qloo's score (for example 0.84 out of 1, with "toward" and "back"), our own rough estimate in small type, the draft, the facts the Writer was given, the Clearance record, and "How the agents got here", which lists every step with a time.

Button	What it does
Approve	Greyed out while Clearance holds the card. On a desk you've verified as yours, it's "Approve and send" and the message really goes. Anywhere else it's a simulation: the card records what would have happened, and nothing is sent.
Hold	Parks the card.
Edit	Save your own wording. Clearance checks it again, and it stays on hold until you approve it.
Reject	Asks why. That reason really is handed to the Writer as a standing note for the desk's next drafts.
Undo	Puts a decided card back on hold. If a real send hasn't gone out yet, this cancels it.

Sending for real

Approving on a desk sends the real email or letter, straight from the desk, in the desk's name. The only condition is that whoever approves has shown once that the desk is theirs. Otherwise anyone could open the Live Nation desk and post letters signed as Live Nation's team.

From a search to a letter in the post

1. Go to syzygybot.com/desk and type the brand in the search box. A clear match opens its desk. A vague one shows a list, so pick the right one.
2. The live run starts by itself. Give it a few minutes, and cards land under Requests.
3. At the top of the desk: "Is this desk yours?" Enter your email at the desk's domain (it tells you which, e.g. liquiddeath.com) and press "Send me a code".
4. A six-digit code arrives from agent@syzygybot.com. It lasts 15 minutes. Enter it and press Verify. The banner turns green: "Live desk."
5. Pick a card marked "letter". It now has a REAL LETTER tag. Read the draft, and use Edit if you want to change it. What's on the card is exactly what gets sent.
6. Press "Approve and send". A warning says a real letter is going out in your name as the desk. Press "Send it". Tick "Don't show this message again" and that browser stops asking.

7. The letter goes to PostGrid right away and the card says so. If a gate stops it, the card says which one and why.

Emails work the same way, except they wait for the recipient's sending window.

> **How a desk knows its domain.** The hackathon desks have theirs fixed (livenation.com, goldenglobes.com, qloo.com, thisweekinstartups.com and launch.co). A website desk uses the root of its own site (onenept.com), as long as that domain takes email. For every other desk, it's the official site in Qloo's record. When Qloo has none, one web search finds the domains the team mails from (an artist's management company, say), and a domain only counts if it really receives email. Gmail-style addresses never count. Neither do majors and big agencies like Sony Music or CAA, since thousands of people there have nothing to do with that one act. Verification belongs to the browser and the desk, so a judge who verifies the Live Nation desk can't send from Bad Bunny's.

What happens after you approve

	Email	Letter
When	In the recipient's sending window: Tuesday to Thursday, 09:00 to 11:30 their time. Approve on a Saturday and it waits for Tuesday morning.	Straight to print. PostGrid prints it and hands it to USPS within two business days.
Limits	Five real emails a day across every desk, and one per company per day. Over the limit, it waits for the next run.	Ten real letters a day across every desk, since each one costs money.
From	agent@syzygybot.com, as "Syzygy (AI agent)", signed as the desk	Onenept Studios Inc., Dover DE, signed as the desk
Footer	An opt-out link and the postal address, on every message. Every draft also says in its opening lines that an AI agent wrote it and a person approved it.	

The gates at send time are: not on the do-not-contact list, the person hasn't left the role, Clearance passes under the full default rules, the footer is in place, and for letters, the postal address reads cleanly field by field. A message that fails one is held, and the card says why.

> **Switched on 24 October.** Real email (`MAIL_LIVE`) and real PostGrid letters (`POSTGRID_LIVE`, using the live key) are both on in production. If PostGrid refuses a letter (no payment method on the account, a bad address), the card shows it as held with PostGrid's reason, and nothing is charged.

When someone replies

The mail job reads agent@syzygybot.com every 15 minutes and matches each reply to the message it answers. The Inbox agent sorts it: interested, not now, referral, opt-out, out of office, or other.

- Opt-out, by reply or by the link: the address goes on the do-not-contact list, and anything unsent to them is cancelled. No reply goes back.
- A bounce: the message is marked bounced, and anything else waiting for that address is cancelled.
- Any other human reply (out-of-office aside) is emailed to admin@onenept.com with the whole thread, so a person picks it up.

The other moving parts

Studio clearance desk

Its run pulls the newest cards the other desks filed and checks each one again from scratch. It's also the only desk with the rules panel. Switching a rule off re-checks cards against what's left, but only in your workspace. Real sends always use the full default rules. The seven rules:

- AI disclosure up front
- No implied endorsement
- Sending rules for the recipient's country
- Germany: letters only without consent
- Published addresses only
- Never pitch someone who left the role
- No category-exclusivity conflict

There's also a fixed check that audiences are never described by ethnicity, sexuality, age, religion, politics, health or crime.

Market Watch

Shows on desks that have news topics, refreshed every six hours. For now it only reads the news. Nothing it finds turns into a card yet.

/admin, the operator's room

Rebuilt 26 October. It's behind the admin key, same sign-in as before. Three tabs:

Tab	What's in it
Activity	Every agent step from the action log, newest first. Filter by agent, by desk, or by any text.
Errors	When the desk and mailbox jobs last ran, failed runs, sends that were held, failed or bounced, dropped cards grouped by reason, and logged failures. Plus a link to the Vercel logs for anything deeper.
Desk lookup	Every desk with its counts. Open one to see its runs, sends, replies, cards and verified owners.

Background jobs

Every	What
30 minutes	The built-in desk that went longest without a run gets one, unless it had one in the last 45 minutes. Set-up desks only run when someone opens them.
15 minutes	The mail job: sends approved emails whose window has come, prints approved letters, tracks letters, reads the inbox.
3 hours	The older queue flow (accounts, contacts, sequencer), from before the live desks.

Where things stand on 26 October

- 195 live runs so far: 188 finished, 7 failed. All 7 failures were on 23 and 24 October, mostly a model that stopped answering. None since.

- 499 cards filed by runs, and 11,793 agent steps in the log.
- One real email has ever gone out, on 21 October. No real reply has come back yet.
- Nobody has verified a desk yet, so no send has gone through the desk-owner flow and no letter has been printed. Whether PostGrid has a payment method on file is still unknown. The first real letter will tell us.
- The plan is to verify the Onenept desk with admin@onenept.com and approve one card by hand, inside the Tuesday to Thursday window (27 to 29 October).
